

Daniel Dela Dzikunu

Aspiring Cybersecurity Analyst

Medical Student • Web Developer

danieldeladzikunu@gmail.com • Accra, Ghana • linkedin.com/in/dfour • github.com/dfourmarvel • danieldeladzikunu.vercel.app

PROFESSIONAL SUMMARY

Security-oriented medical student applying a clinical investigative mindset to digital threat analysis and incident documentation. Proficient in Linux security tooling, network traffic analysis, cryptographic implementations, and SQL-based log investigation. Completing the Google Cybersecurity Certificate with hands-on lab work in malware analysis, network defense, and data integrity verification. Additionally designs and deploys full-stack web applications by orchestrating agentic AI development workflows.

EDUCATION

Entrance University of Health Sciences2026 – Present

Bachelor of Medicine and Surgery (MBChB) | Year 1 | Accra, Ghana

Google Cybersecurity Certificate2026 – Present (In Progress)

Google / Coursera | 5 of 8 courses completed

- Network Defense & Monitoring:** Captured and analysed network packets using Wireshark and tcpdump to identify TCP/IP anomalies, protocol behaviour, and firewall principles; examined VPN architectures and email authentication protocols (SPF, DKIM, DMARC).
- Data Integrity & Cryptography:** Performed AES-256-CBC decryption via OpenSSL and Caesar cipher decryption using tr; verified binary file integrity with SHA-256 hashing to detect tampering invisible to plain-text inspection.
- Security Log Analysis:** Wrote SQL queries with JOIN and conditional filtering to audit authentication logs, isolate after-hours failed logins, and flag anomalous geolocations across employee and access datasets.
- Threat Modeling & Governance:** Applied foundational security frameworks (NIST CSF, CIA triad, CISSP 8 domains) to classify assets and evaluate risk profiles; mapped threat vectors against the MITRE ATT&CK framework, analysed vulnerability exposures via MITRE CVE, and studied social engineering and malware threat vectors.

TECHNICAL SKILLS

Security	Wireshark, tcpdump, Detect It Easy (DIE), VirusTotal, sha256sum / cmp, malware triage, hash integrity verification, MITRE ATT&CK / CVE, threat modeling
Cryptography	AES-256-CBC (OpenSSL), Caesar cipher (tr), symmetric encryption, cryptographic hashing for data integrity
Linux / Systems	Bash CLI, file permissions and user management, network packet capture, security log analysis
SQL	SELECT, WHERE, AND / OR / NOT, LIKE, JOIN, ORDER BY; authentication log querying and event filtering
Web Dev	HTML5, CSS3, JavaScript, Supabase (PostgreSQL + Auth), agentic AI development workflows, HTML5 Canvas
Tools	Kali Linux, Ubuntu VMs, Git / GitHub, Python, VS Code

PROJECTS

BibleTTS Twi Transcript Repair — Published Dataset2026

- Identified a data-integrity defect in a published open-source speech dataset: Asante Twi transcripts had two vowel characters silently stripped across all ~21,600 files, undetected since the dataset's release.
- Rebuilt and published the corrected transcripts as an open dataset on Hugging Face (CC BY-SA 4.0), with original and repaired text side by side for auditability.
- Reported the defect upstream on the source repository's public issue tracker, resolving a report that had gone unanswered since March 2024.

Medical Specialty Matching Web Application2026 – In Progress

- Architected a full-stack web application to optimise medical career path decisions, engineering a relational PostgreSQL database schema to ensure data integrity across user profiles and academic metrics.
- Implemented secure user authentication and data persistence using Supabase; Groq API AI matching layer currently in active development.
- Engineered end-to-end via an agentic AI development workflow — orchestrating AI coding agents across system architecture, component scaffolding, database design, and iterative debugging.

Malware Analysis & Incident Triage — False Positive Investigation2026

Artefacts: RUNE64.dll / PlayGTAV.exe | Tools: Detect It Easy (DIE), VirusTotal

- Conducted static analysis on two flagged binary executables using DIE and VirusTotal to isolate Indicators of Compromise (IoCs) and evaluate multi-engine reputation scan results.
- Evaluated binary structural characteristics and compilation metadata to diagnose both files as false-positive alerts.
- Authored a formal incident report detailing triage methodology, static analysis findings, IoC review, and final analyst verdict.

ADDITIONAL

Languages

English (fluent)
Japanese (beginner)

Interests

Medicine and surgery, ethical hacking, penetration testing, CTF competitions, forex and stock trading, Arduino and electronics
